The agency has released imagery of the four-wheeled vehicle landing in Florida, which was also used as a recovery ship for the Orbital Test Vehicle (OTV)-2 on its fourth mission in early June. The OTV-3 mission lasted only five months, according to the USAF. It could not say what the vehicle achieved during its time in orbit, instead referring to the two-orbit flights as "observational test missions", which are said to provide "operational data and technology demonstrations". In late 2014, officials said that the vehicle's batteries died, leaving it without the capability to manoeuvre itself from orbit. It was then left to drift in space until it was finally picked up by the recovery ships and brought back to Earth in late June, after a 15-month mission. The recovery mission was undertaken by the 45th Space Wing in Florida's Kennedy Space Center. The spacecraft was transported back to the Kennedy Space Center before being loaded onto a modified Boeing 747-400 commercial jet, which was flown to Edwards Air Force Base in the California Desert. In February 2015, the recovery ship launched the X-37B from Kennedy to the Navy's remote, high-altitude outpost in the Pacific, where it was refurbished and re-entered the Earth's atmosphere in mid-June.In film industry, there is a demand to develop an apparatus which can take an easy and highly precise measurement of film width, thickness, and density. The demand is applicable to the cases
